

Signed Requests

Signed requests are generally used when using the server-to-server integration.

Spendgo will provide the following unique credentials in order to generate the signature and submit the request:

- **API Key** is passed as the X-Class-Key in the headers when submitting the request.
- **Shared Client Secret** is used to generate the X-Class-Signature in Base 64 encoded format.

All Signed Requests must contain the following headers:

- **X-Class-Key** the account specific identifier
- **X-Class-Signature** the [message signature](#)
- **Content-Type** identifies JSON data format being sent as “application/JSON”

Example request:

```
curl -k -v -X POST -H 'X-Class-Key: test_spendgo_loyalty' -H  
'X-Class-Signature: EMTNgEMeW/E32z/hIFDn1tTVQ017GLC4SiBHNWwRx9w=' -H  
'Content-Type: application/json' -d '{"customer":{"phone":"9999999999"}}'  
https://webservice.skuped.com/loyalty/accounts
```
